

# The KantanISR (Instant Segment Retrainer)

KantanISR technology enables members of KantanMT.com to perform instant segment retraining using a pop up editor. This means that members can add training data to their engines quickly and easily without having to fully rebuild an engine. Adding high quality training data to a KantanMT engine will improve the translation quality of that engine and reduce post-editing requirements.

When you click on the new ISR button  an editor will pop up on the screen. This editor is provided as a convenient way to experiment with this feature and add segment retraining data to your engine. The editor shows the ISR cache. This new training cache will automatically be included in your engine - you don't need to retrain the engine to see the results! After pressing the save button you can continue translating as per normal. (**NOTE:** For best results make sure you use complete segments when entering your ISR data).

## Using KantanISR Technology

**Step 1** - Login to your KantanMT account - <http://kantanmt.com/login.php>

**Step 2** - Select a **client profile** from the client profile list

**Step 3** - Move to the **training data** tab

**Step 4** - Click the **ISR icon** in the training data tab main menu

**Step 5** - Add **source and target text** in the text editor fields and **click save**

Happy MT'ing from the team at KantanMT!
